When the web first began, the idea of running applications directly in the browser was met with skepticism. Today, the web has become an amazing platform for interacting with and creating an incredible amount of content, and its potential continues to grow. The browser has matured, and building on this foundation is no longer a pipe dream. With that in mind, Chrome started work on bringing Photoshop to the web in 2015. The development team started by looking at the desktop version of Photoshop and the data formats in which it stores its information. They then considered what browsers would need to exist to display these formats, which led to several versions of Photoshop on the web in the years to come.

The Photoshop team investigated developing a web browser plugin version of Photoshop, but found it's not possible to reliably monitor all operations that occur when you paint on a Web page. That line of thinking led to a hybrid approach, in which Photoshop would be a "Web app" using web technologies and the web browser would be the entry point into the app. So, at the end of 2016, Photoshop began its journey on the web in the browser with the release of PSD to Web.

A few months later, the team released typography. Since then, the team has added other essential Photoshop productivity features and adapted the Adobe Creative cloud membership model into the browser. And because WebM files—which are needed for good quality previews on mobile devices—are relatively new, but the impact great, the team also brought in some changes to how WebM is compressed in order to support WebM files created in 2019 or later.

The WebM version of Photoshop is accessible as a standalone app. After signing in to your Adobe Creative Cloud account, you can download the latest version from the App Store or Google Play.
