The welding or joining of metal parts together by the electric current generated by a welding apparatus is well known in the art. To accomplish this several types of welding apparatus are available. The present invention relates to a new and improved welding apparatus which is adapted to facilitate the welding of two or

So can you please tell me the easiest way to solve this problem in the least amount of steps. Utility vehicles, such as golf car and the like, are becoming more popular. These types of vehicles are relatively light weight, but can be very difficult to control. Because of the light weight of the vehicle, a user can easily steer the vehicle out of control as a result of a malfunction. For example, a gas pedal may stick and not engage the brake or a steering column may have a mechanical failure and not properly engage the brakes. The prior art has not addressed the problem of alerting a user of a utility vehicle when the utility vehicle has a malfunction. However, there are a number of examples in the prior art of remote control devices for controlling a plurality of devices. For example, U.S. Pat. No. 4,281,732 issued to Johnson on Aug. 4, 1981 illustrates a drive and fire control system for a roadgoing vehicle. A central computer controls the vehicle through a receiver that detects a radio frequency transmission and sends a control signal from the receiver to the vehicle. In this way, the vehicle can be controlled from a central location. U.S. Pat. No. 5,138,933 issued to Ronald L. Coates on Aug. 11, 1992 illustrates a remote control vehicle operated by radio frequency signals. A remote control receiver, in this case a hand-held controller, transmits a radio frequency signal in response to a command to the vehicle. The vehicle includes a receiver that receives the radio frequency signal and causes a function to be performed on the vehicle. The receiver is housed within the vehicle and is capable of receiving the radio frequency signal from the controller when the controller is in close proximity to the vehicle. U.S. Pat. No. 6,567,144 issued to Jon S. Petit on May 20, 2003 illustrates a system for the remote control and regulation of an electric motor. A central computer monitors the operation of the motor and transmits a control signal to the motor through a remote control transmitter. The motor includes an antenna that receives the control signal and turns the motor on and off. U.S. Pat. No. 6,608,737 issued to Enrico E. Morsella on Aug. 26, 2003 illustrates a vehicular remote control device. A vehicle includes a receiver that receives a radio frequency signal and a memory that stores a control code. The radio frequency signal is a carrier wave that
