I have used your product for a couple of years and I really love it. I work in a customer service role and I tell clients about your product. I find it easy to use and most importantly, easy to understand. I love the "risk free" assurance, because I have made myself a fan of the product and been. Thanks a lot! How to get Rid of Error Code 207 on Windows 2016 Server Updated? Thank you for a great product. I have been a user of 1-Click Tools and had problems with the website. I am a new computer tech and was looking for a program to help me solve these problems. I found your product and it has helped in getting my computer running like it should. The support was also very professional.Â .Q: AspectJ aspectj.xml -- get method arguments Problem I have a Spring application that exposes a web service for communicating with a separate backend application. The backend application does not expose any services, but will be implemented by another developer. I would like to expose a set of variables (e.g. "current_user") in the backend application so that the web service application may retrieve them and potentially use them. The concept behind the above is that I would like to somehow make the web service application aware of the possible source of the current_user variable. The web service application has no control over the implementation of the backend application, and I do not want to make the backend application aware of the web service application. What I Have So Far I am using AspectJ (version 1.6.11, Java 1.6) with the aspectj-maven-plugin in order to instrument the backend application at compile time, so that when I deploy the backend application to a web server, the web service application will be able to use the variables at runtime (i.e., on each request). The aspect script looks like this: import org.aspectj.lang.ProceedingJoinPoint; import org.aspectj.lang.annotation.Aspect; import org.springframework.stereotype.Component; @Aspect public class BackendAspect { @Pointcut("execution(public * *(..)) && @within(BackendListener.class)") public void useBackendService() { } } c6a93da74d
