autocad 2012 software torrent autocad software torrent. autocad mechanical torrent.q: getting a signature from a primitive i am trying to calculate a signature from a primitive (i.e. not encoded as a string). what is the best way of doing this? the input is expected to be a binary stream (stdin in c), and the expected output is the same binary stream (stdout). i tried ifstream in(0); ofstream out(0); unsigned char buffer[128]; in.read(buffer, 128); // calculate signature out.write(buffer, 128); but the out.write() doesn't write 128 bytes. it appears as if it's failing to allocate the necessary amount of space. a: you are trying to write a pointer, not a byte array (the array decay to the pointer during the assignment). you can fix it by changing your line to out.write(buffer, sizeof(buffer)); q: how to use multiple subjects as an observer? suppose the following code, which produces correct answers but in an unusual fashion: \$subject = new subject('test1'); \$subject->attach(['before' => 'an error', 'after' => 'an expectation',]); \$subject->attach(['after' => 'just another error', 'before' => 'another expectation',]); \$result = \$subject->send(new subject('test2')); \$response = \$subject->send(new subject('test3')); the difference between test1 and test2 is that test1 was attached before 'just another error', while test2 was attached before 'another expectation'. the difference between test2 and test3 is that test2 was attached after 'an error', while test3 was attached after 'an expectation'. so what i'm trying to do is to attach test2 before 'an error' and test3 after 'an expectation'. it is easy to use a single subject with multiple observers as such: \$subject = new subject('test2'); \$subject->attach(['before' => 'an error', 'after' => 'just another error',]); \$subject->attach(['after' => 'an expectation', 'before' => 'another expectation',]); \$subject->attach(['before' => 'test2 completed', 'after' => 'test3 completed',]); \$result = \$subject->send(new subject('test3')); but this creates the error just for test2. i want to be able to attach the same subject multiple times, and have it behave like test3: be attached after 'an expectation', and attached before 'test2 completed'. is this possible? note: i'm actually using <https://github.com/fast/fastnosynchronizer> for testing a: don't use a subject as a mock object. a subject is the implementation of a bounded message queue. you are using it to replace those queues. so use it as a queue, not as an observer. the order of attachment is not particularly relevant and each observer will note its notifications accordingly, whether they are raised after or before any attachment.
